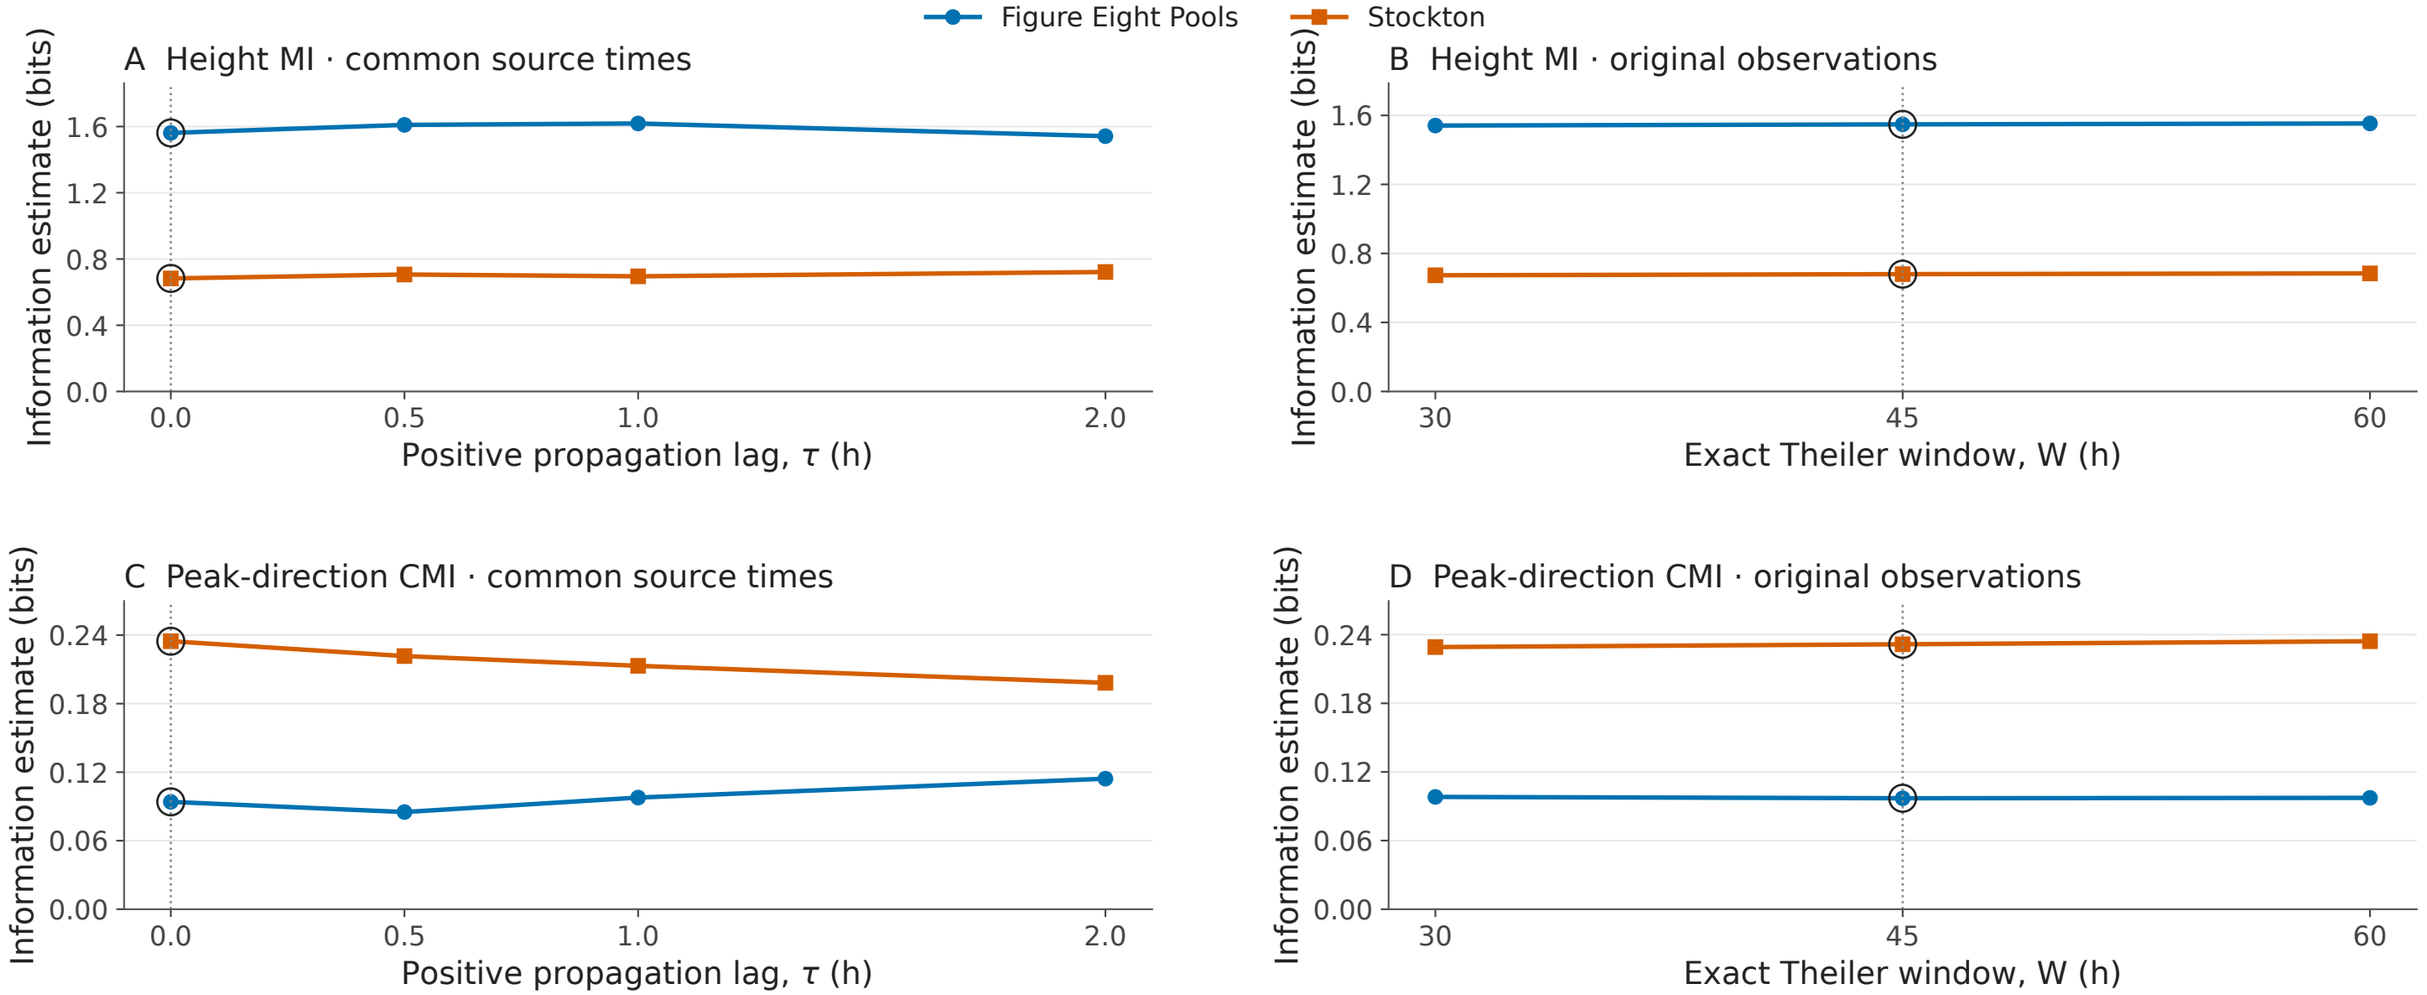
# Temporal sensitivity of the observed site relationships

k = 4 throughout · saved Step 9 estimates · descriptive comparisons



Lag panels: site-specific common source times, N = 6,316 / 10,307 (FEP / Stockton); W = 45 h.

Window panels: original N = 6,867 / 10,522, zero lag. Rings mark the reference within each cohort.

Positive lag: offshore(t) → nearshore(t + τ). Common-cohort lag = 0 differs from Step 7. Panel scales differ.
